Vedant Vijay Shinde

(201) 668-7085 | Jersey City, NJ (Open to Relocation) | shindev124@gmail.com | Portfolio | LinkedIn | GitHub

PROFESSIONAL SUMMARY

Data Analyst with 2+ years building Power BI dashboards, SQL pipelines, and forecasting models across transportation, supply chain, and e-commerce, cutting reporting effort 40–45% and stockouts 15% through automation and predictive analytics. MS Information Systems, Stevens (GPA 3.94); F-1 OPT, no sponsorship required.

EDUCATION

Master of Science in Information Systems *Sep 2024 – May 2026*
Stevens Institute of Technology | Hoboken, NJ | GPA: 3.94 | ***Master's Scholarship*** | ***Beta Gamma Sigma Honor Society***

Bachelor of Engineering in Information Technology *Sep 2020 – May 2024*
University of Mumbai | Mumbai, MH, India | GPA: 3.44

TECHNICAL SKILLS

Languages & Tools: Python (Pandas, NumPy, Scikit-learn), SQL (SQL Server), R, Excel (PivotTables, Forecasting), AWS, Git
Business Intelligence: Power BI (PL-300 Certified), Tableau, Dashboard Development, KPI Design, Data Visualization
Analytical Methods: RFM Segmentation, Cohort Analysis, A/B Testing, Regression Analysis, Supply-Demand Analysis

PROFESSIONAL EXPERIENCE

Stevens Institute of Technology | Hoboken, NJ
Data Analyst *Nov 2025 – Apr 2026*

- Cut data inconsistencies 20% and reduced processing time 30% by unifying operational datasets across 12+ U.S. cities, standardizing disparate city feeds in Python (Pandas, NumPy, GeoPandas) through schema validation and geospatial joins
- Shaped multi-city transportation investment recommendations by quantifying service equity gaps across 12+ U.S. cities, applying statistical distribution metrics (Gini, coefficient of variation, quantile analysis) across 5 operational dimensions
- Automated recurring reporting to eliminate 45% of manual workload, building reusable Python scripts with parameterized refresh logic that streamlined stakeholder deliverables across the research team

Data Analyst (Summer Fellow) *May 2025 – Jul 2025*

- Enabled the research team's first cross-regional benchmarking across 9 cities by architecting a Python and AWS pipeline (S3 staging, EC2 processing), consolidating 5M+ operational records from 8 transit systems into a centralized dataset
- Uncovered 3 critical service coverage gaps across 9 regions through demographic and operational analysis in SQL and Python (joins, aggregations); findings cited in the team's policy recommendation report to city-level transit agencies
- Guided resource allocation at 4 city-level agencies by building Tableau dashboards visualizing the top 3 drivers of operational delays by geography, presented directly to stakeholders to inform service planning

Terna Engineering College | Navi Mumbai, MH, India
Data Analyst *Feb 2023 – May 2024*

- Consolidated 3 years of procurement data into the department's first unified dataset, designing an inventory analytics pipeline that queried 50,000+ rows in SQL and restructured records with Pandas across 8+ categories, cutting data prep time 35%
- Replaced legacy Excel reporting and improved prep time 40% by deploying a 4-dashboard Power BI suite covering inventory turnover, supplier lead times, and enrollment-driven demand with drill-through navigation
- Forecasted peak-period demand to reduce stockouts 15%, building a Python model using moving averages, exponential smoothing, and enrollment-driven calendar variables, validated against 3 prior years of data

DATA ANALYTICS PROJECTS

Supply Chain Intelligence: Global Logistics Analytics | GitHub *Mar 2026 – Apr 2026*

- Quantified cost leakage across a global logistics network by engineering a Python pipeline with 7 SQL scripts (CTEs, window functions, IQR anomaly detection, PERCENT_RANK scoring), surfacing 50 unprofitable routes, 13,027 delivery anomalies
- Produced a case study documenting 92.6% of routes exceeding cost thresholds by building a 5-dashboard Power BI platform (star schema, DAX measures, row-level security) alongside an Excel scenario workbook using Power Query and INDEX-MATCH

Customer Segmentation & Retention Analytics | GitHub *Feb 2026 – Apr 2026*

- Segmented 5,878 customers across 1M+ transactions into 9 RFM groups in SQL (NTILE, LEAD, running SUM), surfacing £2.07M at-risk revenue and 61% first-purchase attrition; validated with chi-square ($p < 0.01$) and Cohen's d (> 0.8)
- Projected £673K–£795K in recoverable revenue by delivering a 5-dashboard Power BI platform with 22+ DAX measures, row-level security, and What-If simulation, translated into a McKinsey-style case study with 3 prioritized retention recommendations

CERTIFICATIONS

Microsoft Certified: Power BI Data Analyst Associate (PL-300) (Microsoft) | Google Data Analytics Specialization (Coursera)
